

SwiftStack Controller On-Premises Management

The SwiftStack Controller is a multi-cluster product that offers a single pane view into Swift clusters installed with SwiftStack agent software. The SwiftStack Controller is packaged with the latest version of Swift. The first node of a new cluster will always get the latest version of Swift, while any subsequently-added node will get the same version of Swift as is running on all the other nodes. To change the version of Swift a cluster is running, you just initiate a Rolling Swift Upgrade.

SwiftStack Nodes are running the SwiftStack agent `ssnoded`, which is responsible for talking to the Controller and monitoring the Swift processes on each node.
