

## IPC Dispatcher The

ConvergenceTP IPC Dispatcher is a subset of the M2M module. The IPC Dispatcher is a powerful and easy to use application with your VMS system that responds to commands from PLC controllers to not only initiate camera call-ups but initiate IP device activations such as unlocking doors, turning on lights and generating generic events all in response to one alpha-numeric text command received by the IPC Dispatcher from the PLC controller. The IPC Dispatcher is listening for the alpha-numeric text which is referred to as a key. The user-defined combinations of events are automatically executed without any human intervention.

ConvergenceTP IPC Dispatcher is a subset of the M2M module. The IPC Dispatcher is a powerful and easy to use application with your VMS system that responds to commands from PLC controllers to not only initiate camera call-ups but initiate IP device activations such as unlocking doors, turning on lights and generating generic events all in response to one alpha-numeric text command received by the IPC Dispatcher from the PLC controller. The IPC Dispatcher is listening for the alpha-numeric text which is referred to as a key. The user-defined combinations of events are automatically executed without any human intervention.

- Wide range of PLC and IP Appliance interface options available.
- Supports an unlimited number remotely connected and completely remotely controlled video clients
- Remote clients can be set to fixed screen layout, or set to dynamically adjust the screen layout.
- When used in combination with the C2P Procedure Manager events can easily be setup to send "Generic Events" into your VMS.
- The fixed screen layout provides video matrix functionality to switch camera feeds within the fixed layout.
- The dynamic screen layout option allows the remote IP client to adjust the view layout based on camera count.
- The remote IP Client can be set to full screen or windowed mode, supports PTZ presets and can be displayed or minimized to the tray all completely under control of TCP/IP or UDP commands sent over the network.
- The easy to use GUI module allows users to define rules and set a variety of modes such as, from single command to single IP Client, or from single command to multiple IP Client broadcast functionality.
- The GUI module allows the user to configure what camera goes to what view pane in the remote client as well as an optional dwell time for the event to be shown.

Easy to use GUI puts you in control to setup clients, camera views and alert procedures

Receiving command Key 341 will place camera named CTP Overview79 onto client 127.0.0.1 as a 1 x 1 view
