

CASE STUDY: MILITARY SITE

INTEGRATING FENCE DETECTION WITH VMS

CUSTOMER: Overseas Military Site

CHALLENGE: To implement a VMS upgrade and integrate with two existing perimeter intrusion detection fence systems

SOLUTIONS:
INTREPID™ MicroPoint Cable Fence Detection System

INTREPID™ MicroPoint II Fence Detection System

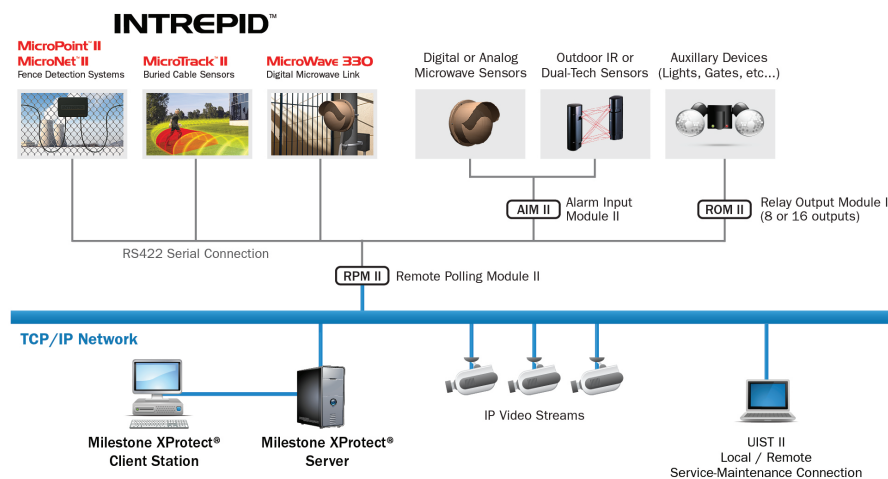

Milestone XProtect® Video Management Software

An overseas military site is currently using both the original INTREPID™ MicroPoint Cable, which has reached product retirement, and the latest MicroPoint II system to detect intrusions at the perimeter fence boundary.

Originally, the fence detection systems were designed to communicate with a third-party VMS through a custom development that no longer functioned correctly. The client decided to turn to Milestone for a complete upgrade of their video surveillance system which enabled the use of both the Southwest Microwave INTREPID™ Series II Perimeter Module plugin and the original MicroPoint plugin to gain visual assessment of perimeter intrusion attempts.

This is the first site that will implement both plugins to accommodate the two fence detection sensor systems. Site security personnel will upgrade the remaining MicroPoint Cable systems to MicroPoint II with the confidence that site protection will be seamless throughout the transition.

This is only possible because of the partnership between Milestone and Southwest Microwave which continues to prove itself essential for the management of security-sensitive sites.
